

HOLIDAY TREE SAFETY

For many Gwinnett residents, decorating the Christmas tree is a favorite part of the busy holiday season. A live tree can fill your home with beauty and the scent of fresh pine; however, it can also pose a fire hazard if not properly cared for.

Firefighters suggest selecting a fresh tree or one that is green in color. The tree's needles should bend, not break, and should be hard to pull off the branches. The trunk of a fresh tree will be sticky from the sap. When choosing a live tree, bounce the tree trunk on the ground; if a considerable amount of needles fall, the tree has probably dried and could be a fire hazard. After you have selected the perfect tree, remember to properly care for the tree to keep it fresh throughout the holiday. Never place the tree near a heat source like a fireplace, wood stove, or space heater. You should also avoid placing the tree under or near a heat vent in the room. Doing so will cause the tree to dry out faster. Keep the tree stand filled with plenty of water. Check the water level in the stand daily and fill as needed. A real tree should not be put up too early or left up for more than two weeks.

If you're using an artificial tree, choose one that is approved by an independent testing laboratory and made of flame retardant materials. When decorating the tree select ornaments that are made of flame retardant materials. When stringing the tree with decorative lights, remember to use only those lights approved by an independent testing laboratory. Never link together more than three light strands and inspect the strands for frayed wires, bare spots, cracks in insulation, broken sockets, and excessive kinks or wear. Electrical outlets should never be overloaded. Periodically check wires and outlet covers. They should not be warm or hot to the touch.

Candles should be snuffed out and decorative lights turned off whenever you leave the home or before going to sleep. Never place a lit candle near a window, or close to anything that could catch on fire. Keep candles out of the reach of children and pets. Candles should not be placed on or near the tree or decorative wreath.

Preventing Holiday Tree Fires

- **Holiday tree fire hazards:** Special fire safety precautions need to be taken when keeping a live tree in the house. A burning tree can rapidly fill a room with fire and deadly gases.
- **Selecting your tree:** Needles on fresh trees should be green and hard to pull back from the branches, and the needles should not break if the tree has been freshly cut. The trunk should be sticky to the touch. Old trees can be identified by bouncing the tree trunk on the ground. If many needles fall off, the tree has probably dried out and may be a fire hazard.
- **Caring for your tree:** Do not place your tree close to a heat source, including a fireplace or heat vent. Heat will dry out the tree, causing it to be more easily ignited by a flame or spark. Be careful not to drop or flick cigarette ashes near a tree. Do not put your live tree up too early or leave it up for longer than two weeks. Keep the tree stand filled with water at all times to keep the tree moist.
- **Disposing of your tree:** Never put tree branches or needles in a fireplace or wood burning stove. When the tree becomes dry, discard it promptly. The best way to dispose of your tree is by taking it to a recycling center or having it hauled away by a community pick-up service.
